

Proud users of Barnacle Buster™ , a truly green descaler!

Why we chose Barnacle Buster™ ?

Barnacle Buster™ is a safe, non-toxic and biodegradable marine growth remover specifically formulated to **replace hydrochloric, muriatic and oxalic acid** based descaler used in the cleaning of seawater cooled air conditioning. With minimal dismantling required, Barnacle Buster™ can be safely be re-circulated through seawater cooling systems, dissolving barnacles, zebra mussels, calcium, rust, lime & all other mineral deposits.

- **Barnacle Buster™** is biodegradable & can be disposed of through regular sewer system.
- **Barnacle Buster™** is safe for your personnel
- **Barnacle Buster™** passed the California Fish Toxicity Assay Test, Department of Hazardous Substances (Title 22) and complies with NSF International standard 60.
- Based on current EPA guidelines, **Barnacle Buster™** is classified as non-flammable and meets all requirements regarding hazardous and dangerous materials.

When to use Barnacle Buster™?

- As a general rule of thumb, flushing your air conditioning system once a year is a good preventative maintenance measure. *This is especially important on systems that operate in warm seawater.*
- Monitoring your air conditioning system's amperage draw is an excellent way to determine system efficiency. As growth forms inside the condenser coil, heat transfer will be greatly decreased causing efficiency to drop. This will cause then compressor to work much harder thus increasing amperage draw. *Flushing before the problem gets worse could save you a world of headaches!*
- The easiest way to monitor you're A/C's seawater system is to keep a good eye on the seawater discharge stream. Overtime, as growth forms you will notice a change in the flow of seawater. This is a great indication that flushing is needed.

Cleaning Options:

There are two methods to choose from when cleaning your seawater system.

OPEN-LOOP RECIRCULATION: This is the quickest and most preferred method. It requires recirculation of the product and the aid of a flushing system or system pump.

IMMERSION: This is the simplest method of cleaning but also the longest. It involves filling the entire system and allowing it to work overnight.

TRAC recommends open-loop flushing for systems with large amounts of growth .
